### Parkline Inc. Completes Registration in Multiple States to Provide Modular “Closed” Construction

Parkline Inc., an industry leader in small metal building construction, has been rapidly acquiring state certifications to allow for shipment of modular industrial buildings.

“We’re spending a great deal of time and money to ensure that our out-of-state customers’ buildings meet every state certification necessary,” National Sales Manager Ron Dawson said. “This proactive action sets Parkline distinctly apart from other building manufacturers who ignore state certification requirements.”

Essentially, prefabricated buildings that are ready to be set in place cannot be inspected by local officials because the framework of the building is inaccessible. Therefore, Parkline has the building inspected via third-party and/or state officials during building construction. If a company purchases a building that is not certified for “closed” construction, it may face potential legal action or other extensive repercussions such as fines or removal of the building from the premises.

“When a Parkline building arrives at its particular destination, local inspectors will see that the building has been completely certified,” Dawson said. “It’s that simple—there are no more steps to complete when the building arrives. That’s how Parkline rises above the rest—we take care of adhering to the regulations customers may not even know exist.”

Not all states have implemented certification programs, but Parkline is actively obtaining certifications for every state that has a program.

Parkline, Inc. is 100% employee-owned and has more than 60,000 building systems currently in service throughout the United States, Canada and a number of foreign countries. The company, which has been in business for more than 30 years, provides high quality, cost-effective answers to a wide variety of small building needs in the industrial, commercial, and public utility building sectors.
